                                                        The present sequence represents the BLM (Bleomycin) gene cluster, containing open reading frames (ORFS) 8-30. The proteins encoded by the gene cluster are useful for producing peptides and/or polyketide metabolites, especially bleomycin or bleomycin analogues. They are also useful for chemically bleomycin or bleomycin analogues. They are also useful for chemically modifying biological molecules to produce branched methyl groups, and for coupling amino acids and fatty acids. They may be reacted with an apo-carrier protein and coenzyme A to produce a holocarrier protein. The BLM gene cluster or catalytic domains can be used hithiatuly or collectively to produce thiazolidine, thiazoline, bithiazoline and bithiazoline-containing microbial metabolites. The BLM gene cluster may also be used to produce sugars
                                                                                                                                                                                                                                                                                                                                                                   151 CCCGACGACGCGGACCTCGTTGCCCGCGTCGCCCAGGTGCTCGGCCTCGACCTCGACGAA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   800
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       293
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     801 ccecenceacececenaceceacceerceseaccreseaccreseacarcereseacarcereseacer 860
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to identifying orthosomycin biosynthetic genes and its fragment/gene cluster (ABZ66670-ABZ66813), comprising detecting the presence of a nucleic acid sequence coding for a polypeptide (ABP99207-ABP9952). The method is useful for identifying an orthosomycin biosynthetic gene, gene fragment or gene cluster, especially an eventinomicin-type or avilamycin-type orthosomycin biosynthetic gene, gene fragment or gene cluster. The method is useful for detecting the presence of any organism that contains DNA for the production of orthosomycins regardless of the level at which genes for orthosomycin production are expressed by the organism or the amount of orthosomycin produced by the organism. This allows for the detection of new
                                                                                                                                                                                                                                      Identifying orthosomycin biosynthetic gene, gene fragment or gene cluster, by detecting presence of nucleic acid sequence corresponding 17 of flambamycins protein families.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        114 GGCCACCGTCGGCCGGTGGAGGACGGCAAAAACCGGCCCGACGACGGGACCTCGTTGC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                        The invention relates to identifying orthosomycin biosynthetic genes and its fragment/gene cluster (ABZ66670-ABZ666813), comprising detecting the presence of a nucleic acid sequence coding for a polypeptide (ABB99207-ABP99362). The method is useful for identifying an orthosomycin biosynthetic gene, gene fragment or gene cluster, especially an everninomicin-type or avilamycin-type orthosomycin biosynthetic gene, gene fragment or gene cluster or denecting the presence of any organism that contains DNA for the production of orthosomycins (both everninomicin-type orthosomycins and avilamycin-type orthosomycins and avilamycin-type orthosomycins) regardless of the level at which genes for orthosomycin production are expressed by the organism or the amount of orthosomycin produced by the organism. This allows for the detection of new orthosomycin natural products, not produced by the organism
                                                                                                                                                                                                                                                                                                                                                               173
                                                                                                                                                                                                                                                                                                                                                                                                            233

The present invention relates to a method (M1) for identifying genes involved in plant resistance or response to pathogenic infection. M1 comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (M1) is useful for conferring resistance to resistance to a plant to bacterial, fungal or viral infection. The present sequence was used to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CDS
This invention, in the area of plant biotechnology, relates to novel polynucleotides comprising a nucleotide sequence encoding a protein which is involved in or associated with the synthesis, metabolism or which is up-regulated with the synthesis, metabolism or which is up-regulated during grain filling. The plant is selected from corn, tomato, banana, canola, cotton, peanut, sorghum, tobacco, sugarbeet, wheat, and rice. The invention may be useful for the improvement of protein, oil, starch, fibre and moisture content of the cereal grains. In addition, carbohydrate levels may be modified to a more desirable level using the present invention. The present sequence is a DNA sequence encoding a rice protein of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    132
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             186
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             312

(NOVO ) NOVO NORDISK BIOTECH INC. (NOVO ) NOVO NORDISK AS. WPI; 2000-594572/56. 40200056762-A2 22-MAR-1999; 13-MAR-2001 28-SEP-2000. Berka RM, 305 AAF12486; 365 28092 28032 RESULT 14 AAF12486 D ò g ò The invention relates to the gene cluster encoding the polypeptides responsible for the biosynthesis of the polyene antibiotic amphotericin (amph) of Streptomyces nodosus. Polywucleotides of the invention are useful for preparing amphotericin derivatives or analogue antibiotic agents with altered properties and in the biosynthesis of polyketides other than amphotericin. ampholii, ampholi or ampholi mutants are useful of for producing amphotericin derivatives glycosylated with alternative sugars, amphotericin ampholii gene sequences are useful in engineered biosynthesis of perosaminyl-amphoteronolide B; ampholii and perosaminyl-i6-descarboxyl-16-methyl amphoteronolide B; ampholii and ampholi gene sequences are useful for preparing polymethesis of perosaminyl-i6-descarboxyl-16-methyl amphoteronolide B; ampholii and ampholi gene sequences are useful for preparing polymetides capable of addition of mycosamine to a polyketide other than amphoteronolide A or B or for preparing polymetides for in vitro synthesis of GDP-mycosamine. The present sequence is S. nodosus amph biosynthetic gene cluster 27911 27912 AACTCGGCCGGCTCGGCGCCGAGGTCACGTCGCCCCGTACGACGGCGGCGACGGGAACG 27971 27851 o, 244 124 184 64 65 GCGCCGGACTGACCAAGAGCGAGTTGGCCAGGCGCATCCAGAAGGACCGGGCCACCGTCG 27852 gecregraciaeciaecrececeseceaeaeareceaeceaeaeaeaeaeaeaeaeeee 125 GCCGCTGGGAGGACGGCAAGAACCGGCCCGACGACGCGGGACCTCGTTGCCCCGCGTCGCCC Novel cytochrome P450 enzyme and nucleotides encoding the enzyme, use: for preparing amphotericin derivative or analog antibiotic agent with altered properties, in biosynthesis of polyketide other than Sequence 113193 BP; 14248 A; 45141 C; 38354 G; 15450 T; 0 U; 0 Other; P-PSDB; AAE36116, AAE36117, AAE36118, AAE36119, AAE36120, AAE36121, AAE36122, AAE36123, AAE36124, AAE36125, AAE36126, AAE36127, AAE36128, AAE36129, AAE36130, AAE36131, AAE36132. Olsen PB; Clausen IG, Rey MW, Shuster JR, Kauppinen S, Monitoring differential expression of genes in filamentous fungal cells uses fluorescence-labeled nucleic acids isolated from the cells and a substrate of expressed sequence tags.

Claim 88; Page 2105; 3161pp; English.

The present invention describes a method for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of genes in one or more second filamentous fungal cells. The method uses fluorescence-labeled nucleic acids isolated from the responsion of the methods for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of genes in a first filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal cells. Monitoring the came genes in one or more second filamentous fungal cells. Monitoring the companions to be improved. New genes may be discovered, the microorganisms to be improved. New genes may be discovered, or possible functions of unknown open reading frames can be identified and genes can be used to study how FF cells adapt to changes in culture conditions, environmental stress, spore morphogenesis, recombination, advantages over genomic or random CDNA clones including element.

CC genes capabolic pathway engineering. Using ESTS provides several advantages over genomic or random CDNA clones including element.

CC and organisation of the microarrays based on function of the gene and organisation of the microarrays based on function of the ESTS from Fusarium venenatum; AAF11248 to AAF11877 represents ESTS from ESTS from Fashibs4 to AAF11878 represents

                                                                                                                                                .8-APR-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Farnet CM,
```

The invention relates to an isolated ramoplanin biosynthetic pathway polypeptide selected from a polypeptide of open reading frames (ORF) 1-32. The isolated polypeptide are useful for chemically modifying a biological molecule that is a substrate for a polypeptide encoded by a campolanin biosynthesis gene cluster, by contacting the biological contacting the biological molecule. The method comprises contacting the biological molecule with the lasolated polypeptide, where the polypeptide chemically modifies the biological molecule. The method comprises contacting the biological molecule with at least two different polypeptides concoded by ramoplanin ORFS 1-31. The polypeptides are useful for directing the biological molecule with a least two different polypeptides encoded by ramoplanin ORFS 1-31. The polypeptides are useful for directing the biosopratical generating of antibiotic structures. An isolated polypeptide or its concoding mucleic acid sequence is useful for generating derivatives of ramoplanin for improving production or for producing variants of other antibiotics of the peptide class. The isolated polypeptides are useful for sequence in conjunction with other peptide antibiotic precursor, for modifying the containing peptide antibiotic, for minating farty acid structure and/or enhancing farty acid incorporation of the very peptide antibiotic structure, for production of an hydroxyphenylglycine (HPG)-containing peptide antibiotic, for enhancing secretion of ramoplanin products or its variants or derivatives, to chlorinate HPG of remoplanin products or its variants or derivatives, to chlorinate HPG of remoplanin products or its variants or derivatives, to chlorinate HPG of peptide antibiotic precursor, and for designing specific nucleotide generative producing microorganisms. This polymolectide sequence represents the containing the peptide antibiotic producing microorganisms. This polymolecule sequence represents the containing products or a moptimic products or a remoplanin products or a geptide sequen Novel isolated ramoplanin biosynthetic pathway polypeptide useful for chemically modifying biological molecule that is a substrate for a polypeptide encoded by a ramoplanin biosynthesis gene cluster. Sequence 88421 BP; 10639 A; 32391 C; 32663 G; 12728 T; 0 U; 0 Other; Disclosure, Page 87-135; 212pp; English,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  APPLICANT: Marc J. Rubenfield et al.

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: APPLICATION NUMBER: US/09/252,991A
CURRENT APPLICATION NUMBER: US/09/252,991A
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CACCCCCCCACCAACCATGGACCTGGACGAGGAAATCGAGCTGGTCCGCACCGA 302
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CCCCAAGCTGGACGAGGACATGAAGCGGCGCATCATCGCCCTAATCCTGGAGCGCCGTGA 362
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             561
                                                                                                                                                                                                                                                                                                                                                                                                                                            62
Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial BcoxI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2: on bw sp, the same strain used for the BDGP's pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     coccsoccsoccessoccecsoccessccescescescescescesssessesces

melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC ilbrary was prepared by Karutoyo Ossegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; cn bw sp, the same strain used for the BDGP's pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be location/Qualifiers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Drosophila melanogaster genome survey sequence SP6 end of BAC BACN37108 of DrosBAC library from Drosophila melanogaster (fruit ALI), genomic survey sequence.

collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk -. This Drosophila melangaster BAC library (Dros BAC) was made by Alain Billand at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               128

/clone libe "Titulcum adescivum FGAS: Library & CAF Cown (50%) and leaf (50%) tissues from wheat cultivar Norstar after short exposure times to low temperature in the light and in the dark. L2 mRNA populations were combined before constructing the library. The first 6 populations: After 7 days of growth at 2005 from wheat cultivar Norstar after short exposure times to low temperature in the light and in the dark. L2 mRNA populations were combined before constructing the library. The first 6 populations: After 7 days of growth at 200, wheat plants were transferred to 4C in the light. Lam crown sections and green leaf tissu were separately harvested after 1, 3, and 6 hours of low temperature exposure. The last 6 populations: After 7 days of growth at 20C, wheat plants were transferred to 4C in the dark. Lam crown sections and green leaf tissu were separately harvested after 1, 3, and 6 hours of low temperature exposure. First strand synthesis in this library was done in the presence of methylated dCTP thereby protecting from internal cleavage with NotI. In addition, this library used a primer for second strand synthesis that annealed to an artificial sequence (RNA oligo) added before first strand synthesis. Therefore when sequences from EST generated from this library will be masking step will have to be included to mask this RNA masked for vector and adaptor sequences, an additional masking step will have to be included to mask this RNA masked for vector and adaptor sequences, an additional

This sequence is the direct result of the Base calling software
Phred (default parameters). It is the raw base calls. To aid in the
identification of the high quality insert the software Lucy
(default parameters) has been run on this sequence. Lucy identified
the region [21,782].
